

LIGHTING CONCEPTS:

Specular | Diffuse | Emission

Based on Physically Based Rendering (PBR) Theory

LIGHTING CONCEPTS:

Descriptors / Adjectives

Specular

- Reflection
- Mirror
- Shiny
- Glossy
- Wet
- Metallic
- Highlights
- Pings
- Crisp
- Sharp
- Polished

Diffuse

- Soft
- Flat
- Ambient
- Natural
- Rough
- Earthy
- Organic
- Matte
- Weathered
- Dull

Emission

- Bright
- Radiant
- Luminescent
- Glowing
- Self-Illuminating
- Incandescent
- Electric
- Beaming
- Shining
- Luminous
- Illuminated

LIGHTING CONCEPTS: Emission

- **Emission** is any object, material, or texture that is actively emitting light into the scene
- This includes any Lights, Super-heated metals, or Elemental FX like fire/ sparks / lightning / magic etc

beauty element

LIGHTING CONCEPTS:

Specular | Diffuse

- **Specular** - Surface Level Reflections
- **Diffuse** - Light passes through surface and interacts with the material at a molecular level, Scattering and Absorption allow certain colors to re-exit and scatter into scene

LIGHTING CONCEPTS:

Law of Reflection

- Angle of Incidence is equal to the Angle of Reflection $\theta^i = \theta^r$

LIGHTING CONCEPTS:

Surface Reflections - Smooth vs Rough Materials

- Light Beam = a bundle of parallel light rays
- Light Beam remains parallel on incidence and parallel on reflection

Specular Reflection

LIGHTING CONCEPTS: Planar Mirror and Virtual Image

LIGHTING CONCEPTS:

Planar Mirror and Virtual Image

- An Image created by planar specular reflection that does not actually exist as a physical object is referred to as a Virtual Image.
- The Virtual Image appears to be located “behind” the mirror
- Virtual Image distance = Object to Mirror + Mirror to Observer.
- **Speculum** is the Latin word for “mirror”, which is where “**Specular**” derives from

LIGHTING CONCEPTS:

Planar Mirror and Virtual Image

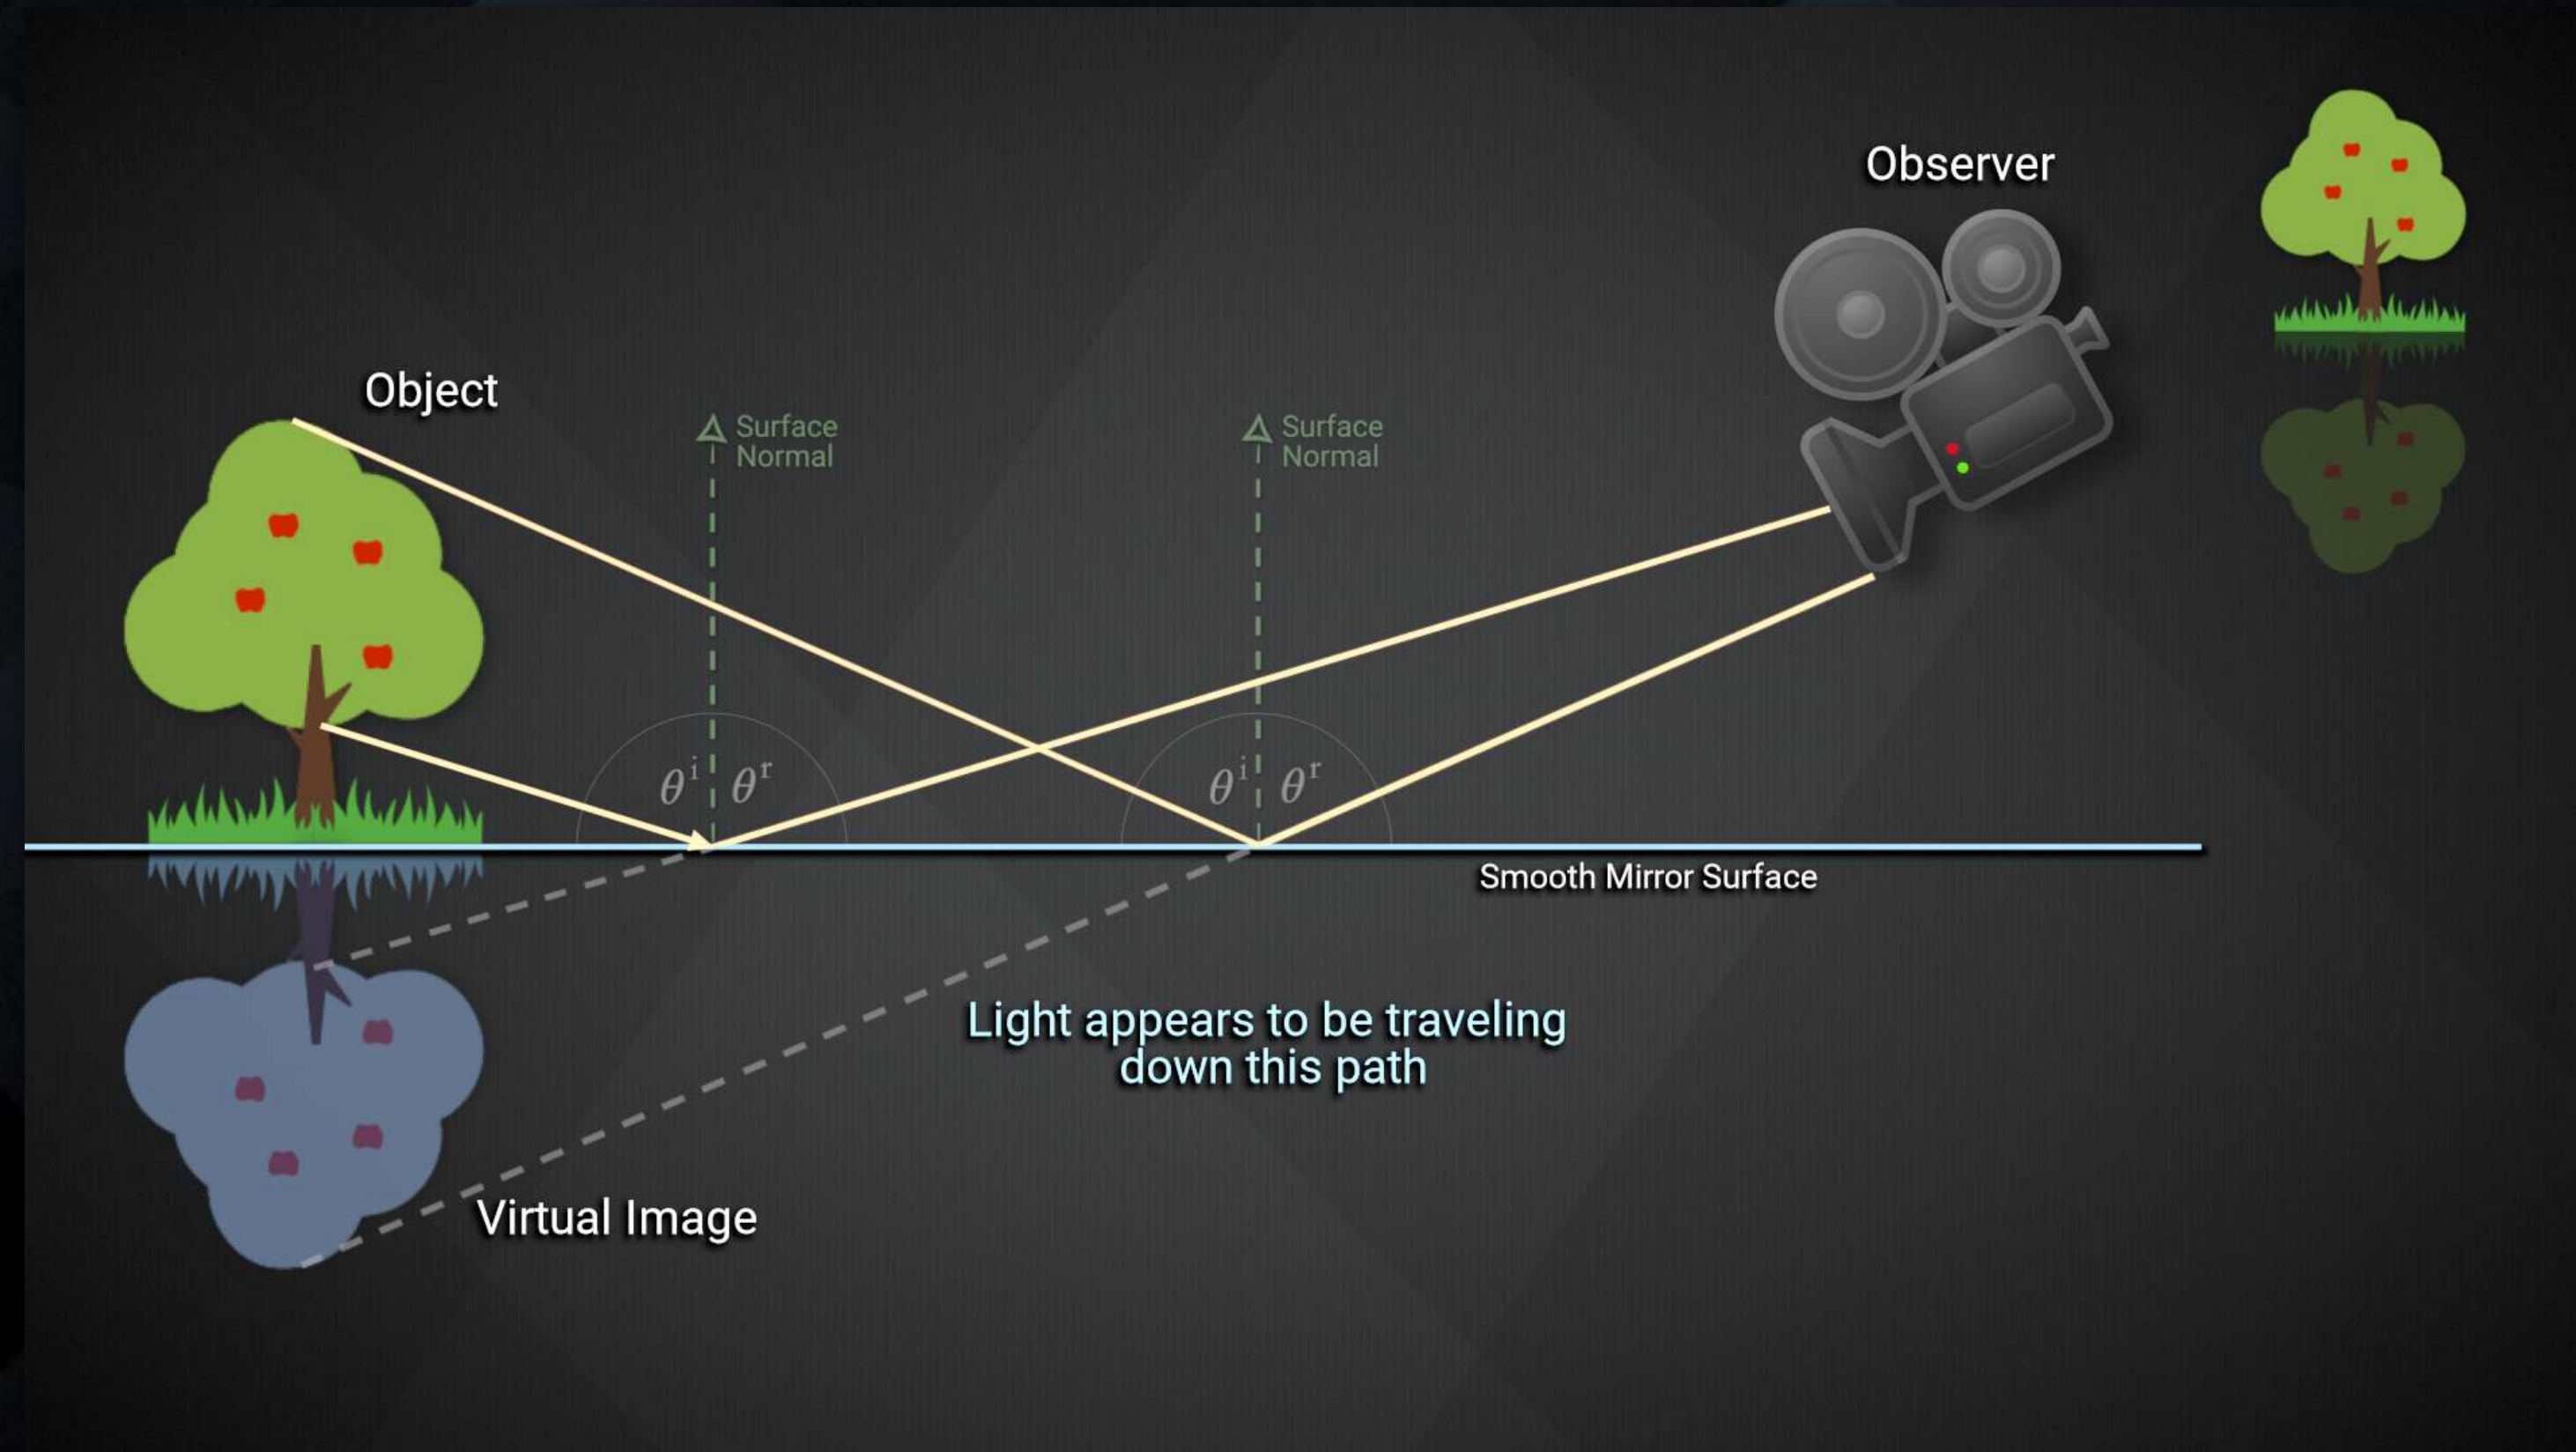

- An Image created by planar specular reflection but does not actually exist as a physical object is referred to as a Virtual Image.
- The Virtual Image appears to be located “behind” the mirror
- Virtual Image distance = Object to Mirror + Mirror to Observer.

LIGHTING CONCEPTS:

Planar Mirror and Virtual Image

- An Image created by planar specular reflection but does not actually exist as a physical object is referred to as a Virtual Image.
- The Virtual Image appears to be located “behind” the mirror
- Virtual Image distance = Object to Mirror + Mirror to Observer.

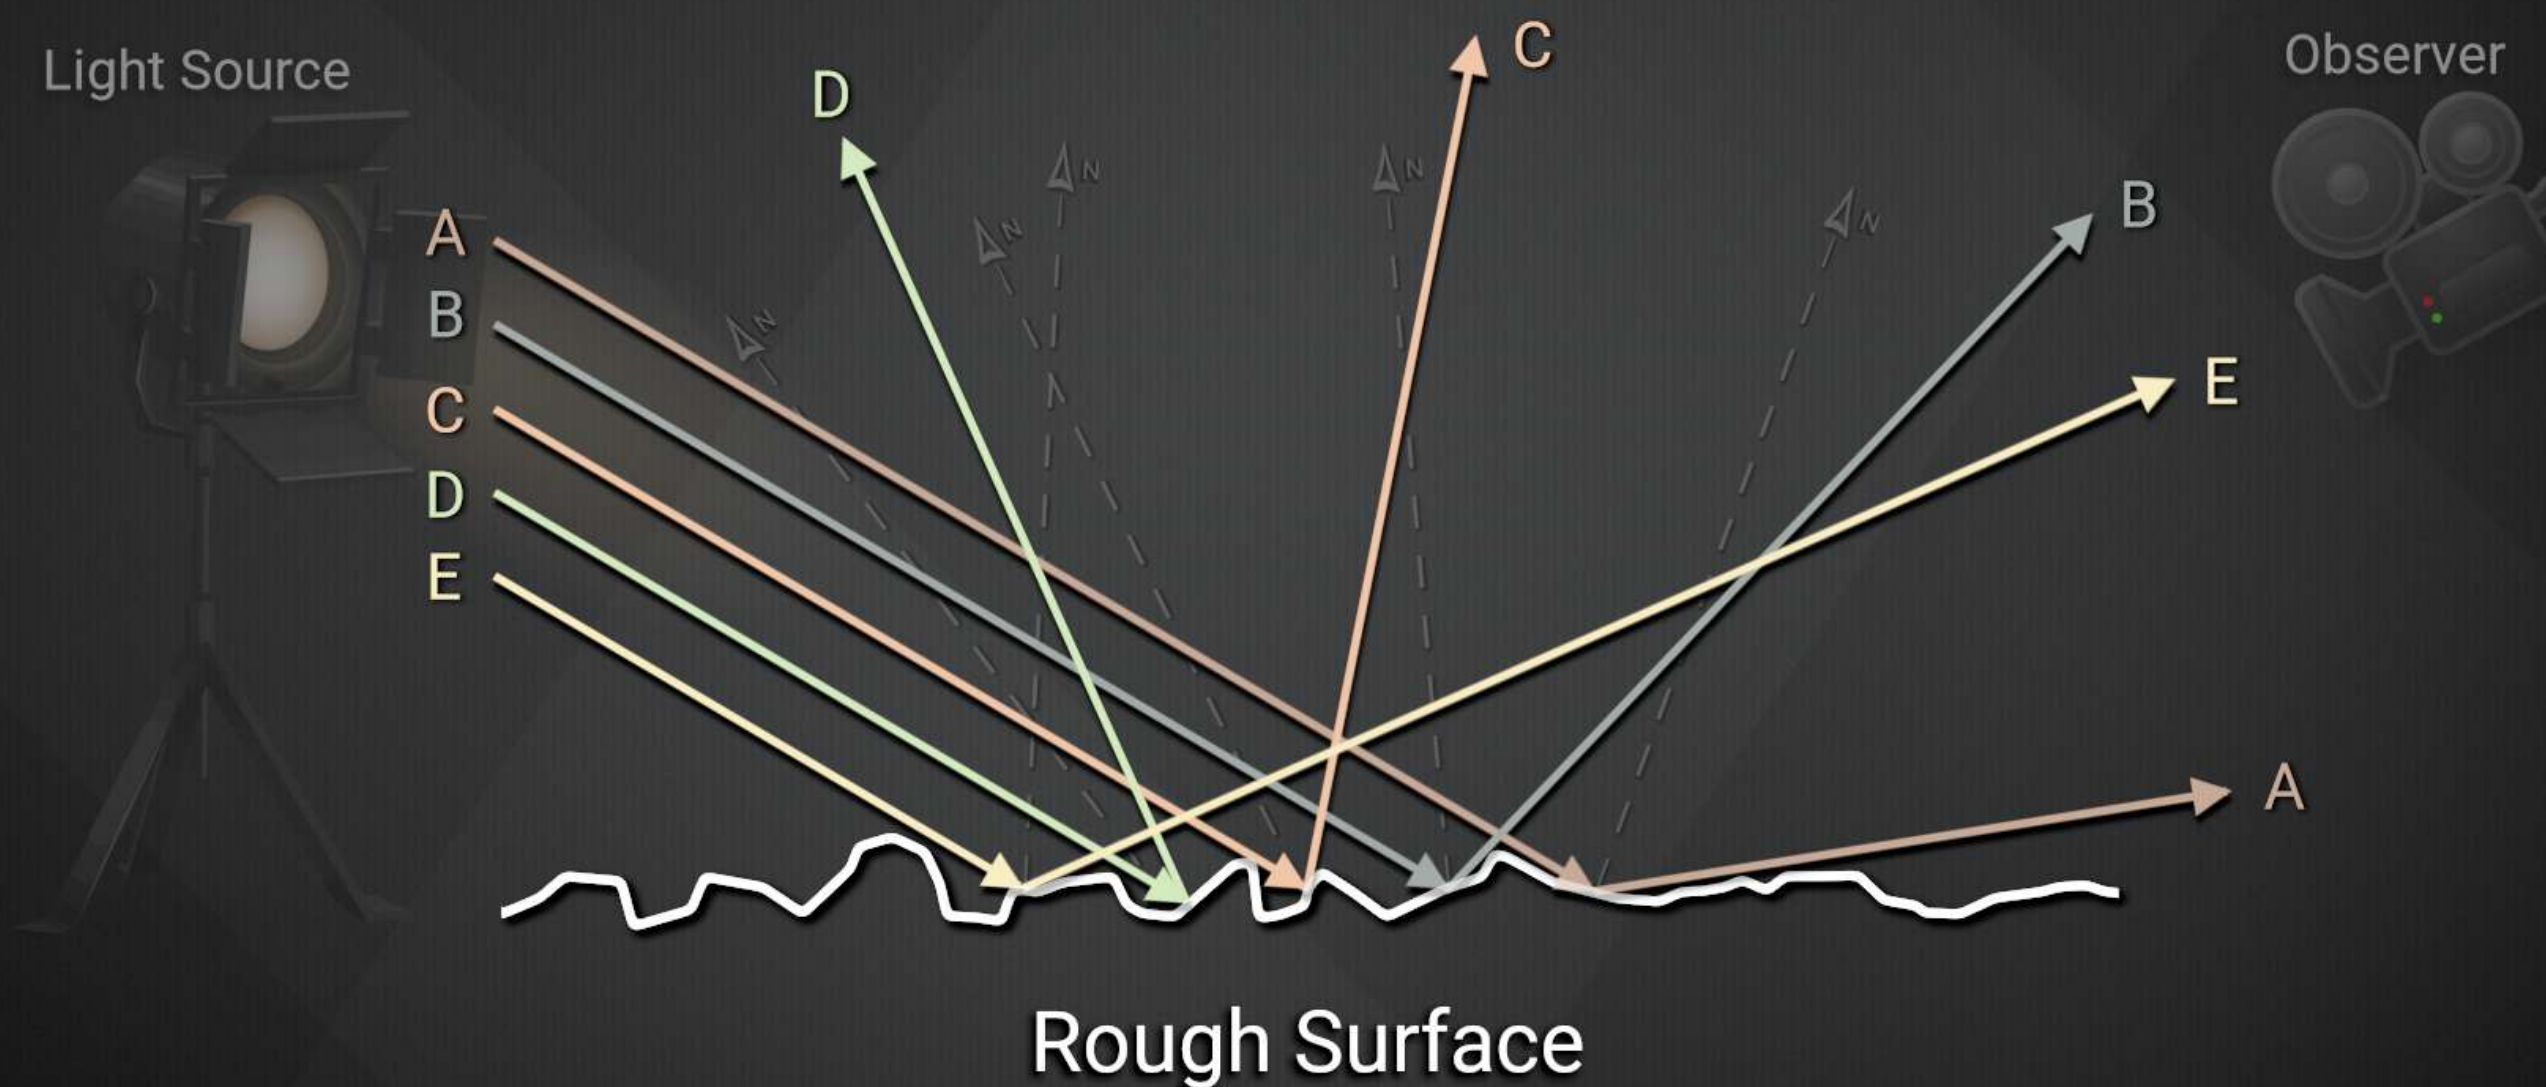

LIGHTING CONCEPTS:

Surface Reflections - Smooth vs Rough Materials

- The uneven surface causes the Incidence Rays to hit at different angles
- The outgoing reflection rays scatter in different directions

Diffused Reflection

LIGHTING CONCEPTS:

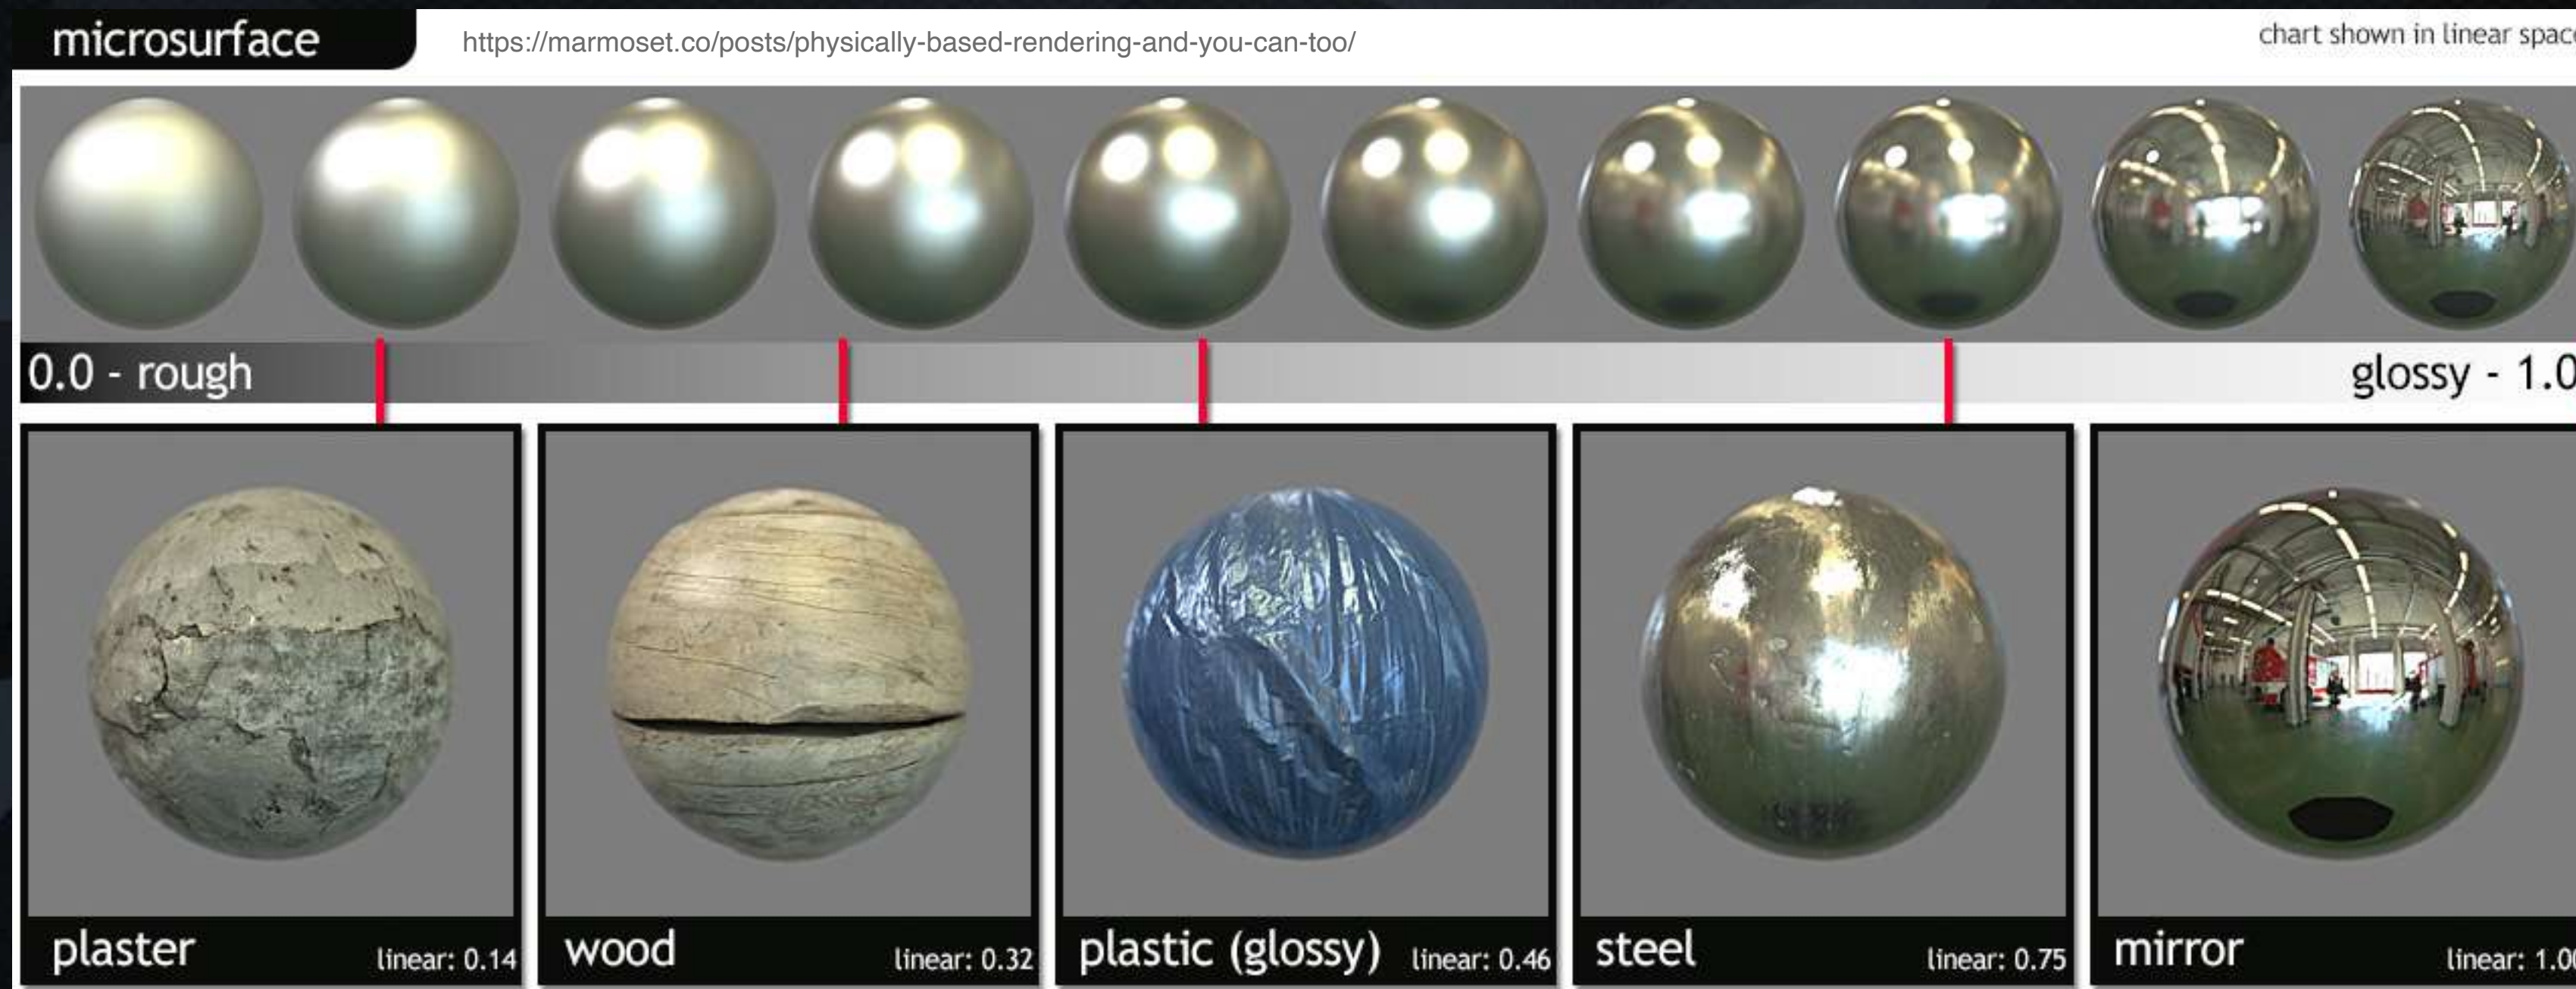

Law of Reflection

- Randomly displacing the vertices of a smooth reflective surface:

LIGHTING CONCEPTS:

Surface Reflections - Smooth vs Rough Materials

<https://clariswiki.com/3.6/reflection2.html>

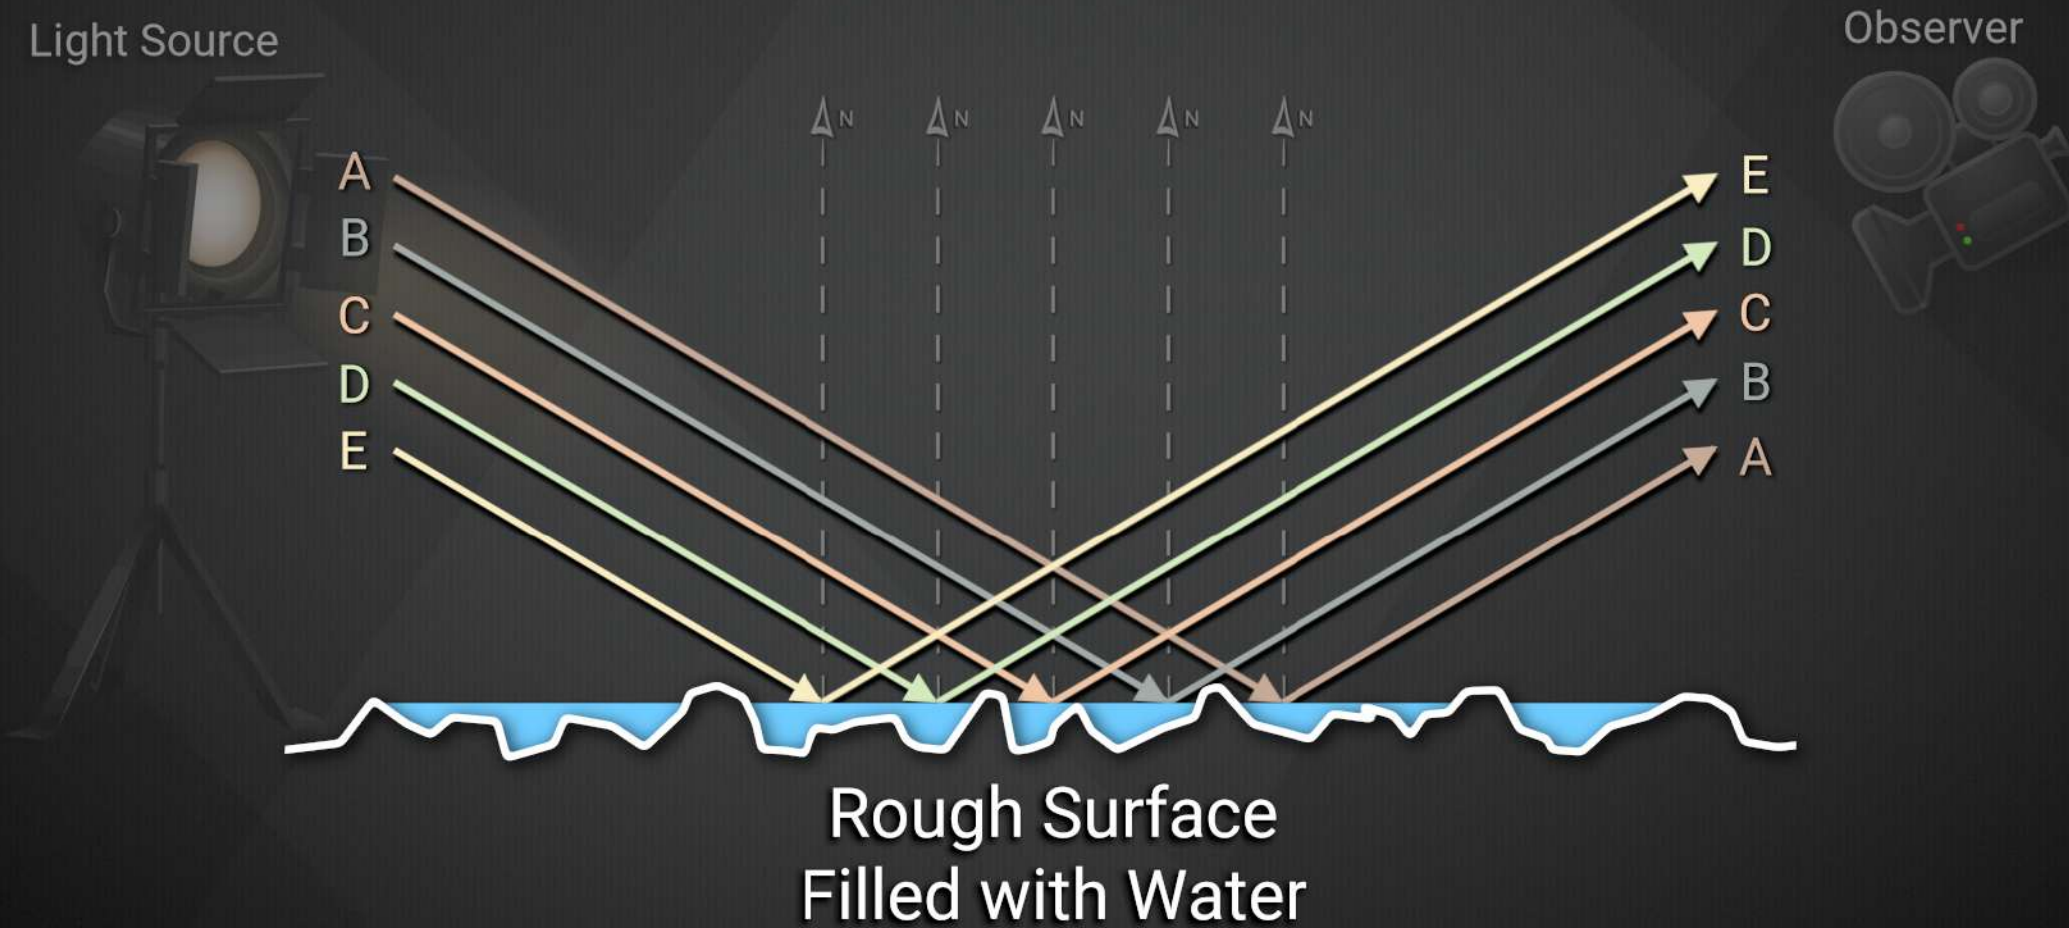

<https://substance3d.adobe.com/tutorials/courses/the-pbr-guide-part-1>

LIGHTING CONCEPTS:

Surface Reflections - Smooth vs Rough Materials

- When a surface is wet, the water fills the gaps and flattens the surface and causes more a specular reflection

Wet Surface Reflection

LIGHTING CONCEPTS:

Surface Reflections - Smooth vs Rough Materials

- Roughness / Smoothness at a microscopic level.

This a regular piece of paper surface zoomed in:

20 μ m
┆┆┆

Width = 686.2 μ m
Mag = 439 X

EHT = 5.00 kV
WD = 9.7 mm

Sample ID =

Signal A = SE2

LIGHTING CONCEPTS:

Specular | Diffuse

- **Specular** - Surface Level Reflections
- **Diffuse** - Light passes through surface and interacts with the material at a molecular level, Scattering and Absorption allow certain colors to re-exit and scatter into scene

LIGHTING CONCEPTS:

Metallic | Dielectric (Non-Metallic)

The **diffuse** and **specular** terms describe two distinct effects going on. The Light interacts with materials differently depending on if the material is a **metal**, or a **non-metal (Dielectric)**

- **Dielectric** - Absorbs and Scatters light.
- **Metallic** - Does not Absorb light. Only Reflects

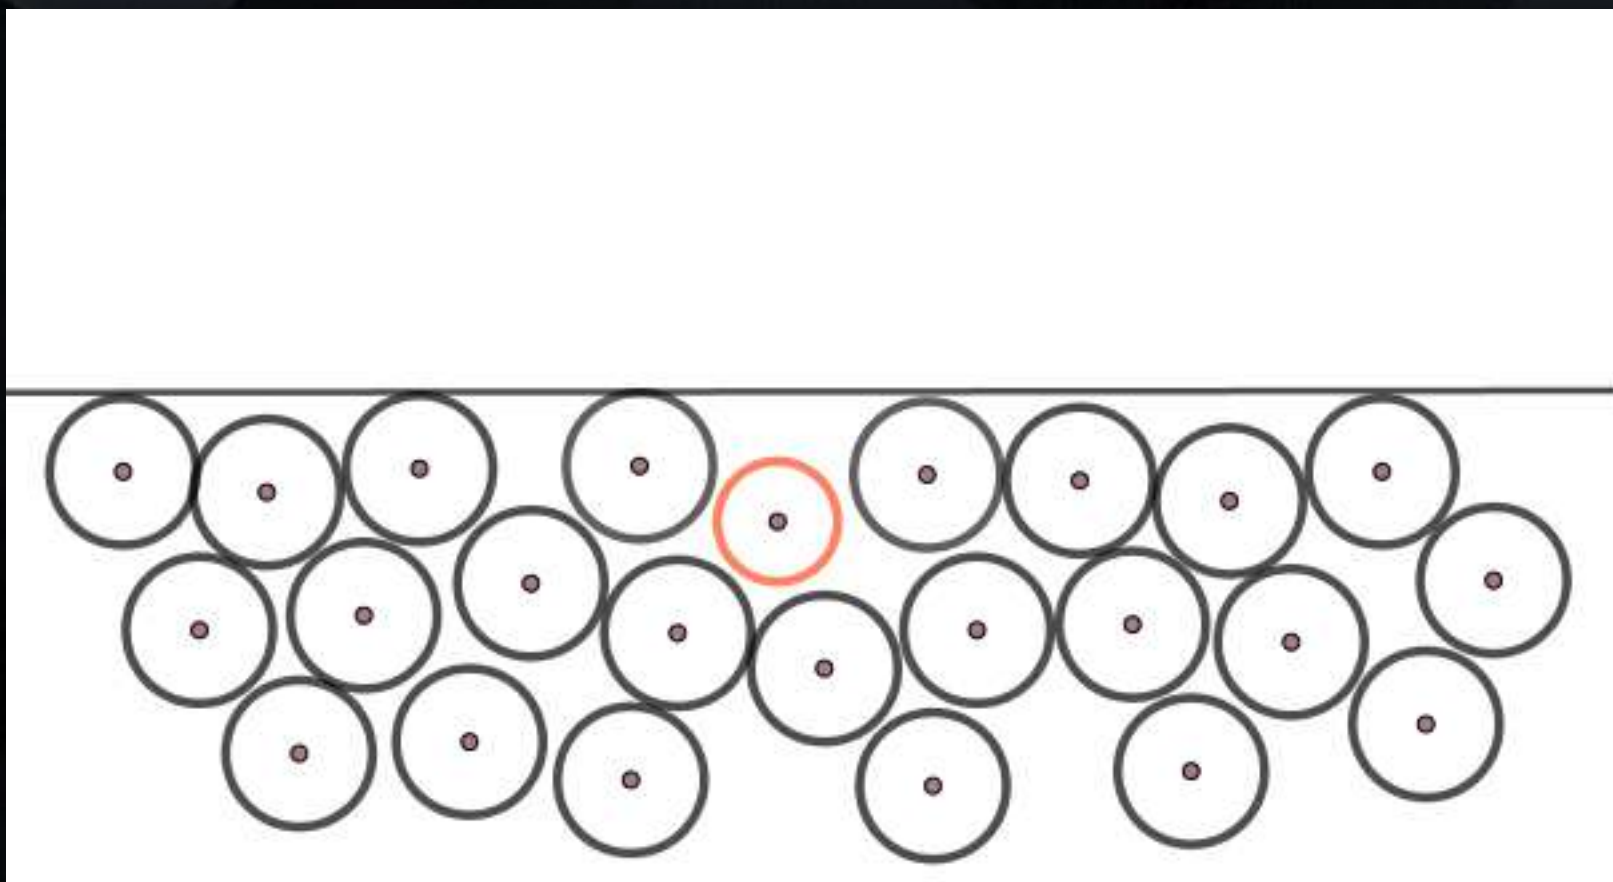

LIGHTING CONCEPTS:

Dielectric (Non-Metallic)

- Light penetrates the surface level and the molecules of the material absorb and scatter the light within
- The light photons excite the atoms they hit below the surface. Some of the light is absorbed, and this energy is converted to heat. Then new light rays (photons) are emitted from the excited atoms. Those might excite nearby atoms or exit the surface as new photons. These new photons are same color as our material.
- The Base Color Texture (Albedo Map) - determines the color of the diffusely scattered photons from excited atoms. It's the color that is scattered back out and not absorbed by the material

Photons excite atoms which emit new photons and excite nearby atoms. This the "scattering" process

<https://cglearn.eu/pub/advanced-computer-graphics/physically-based-shading>

LIGHTING CONCEPTS: Metallic

- Does not Allow light to penetrate the surface and does not Absorb light. They only Reflect light on the surface
- Metals can be thought of as positively charged ions suspended in a “sea of electrons” or “electron gas”. Attractions hold electrons near the ions, but not so tightly as to impede the electrons flow. This explains many of the properties of metals, like conductivity of heat and electricity
- The incoming photon does not excite the atoms, but bounces directly off the electron gas
- The Base Color (Albedo) is used to describe the color tint of the specular reflection

“Electron Gas” Model

LIGHTING CONCEPTS: Diffuse

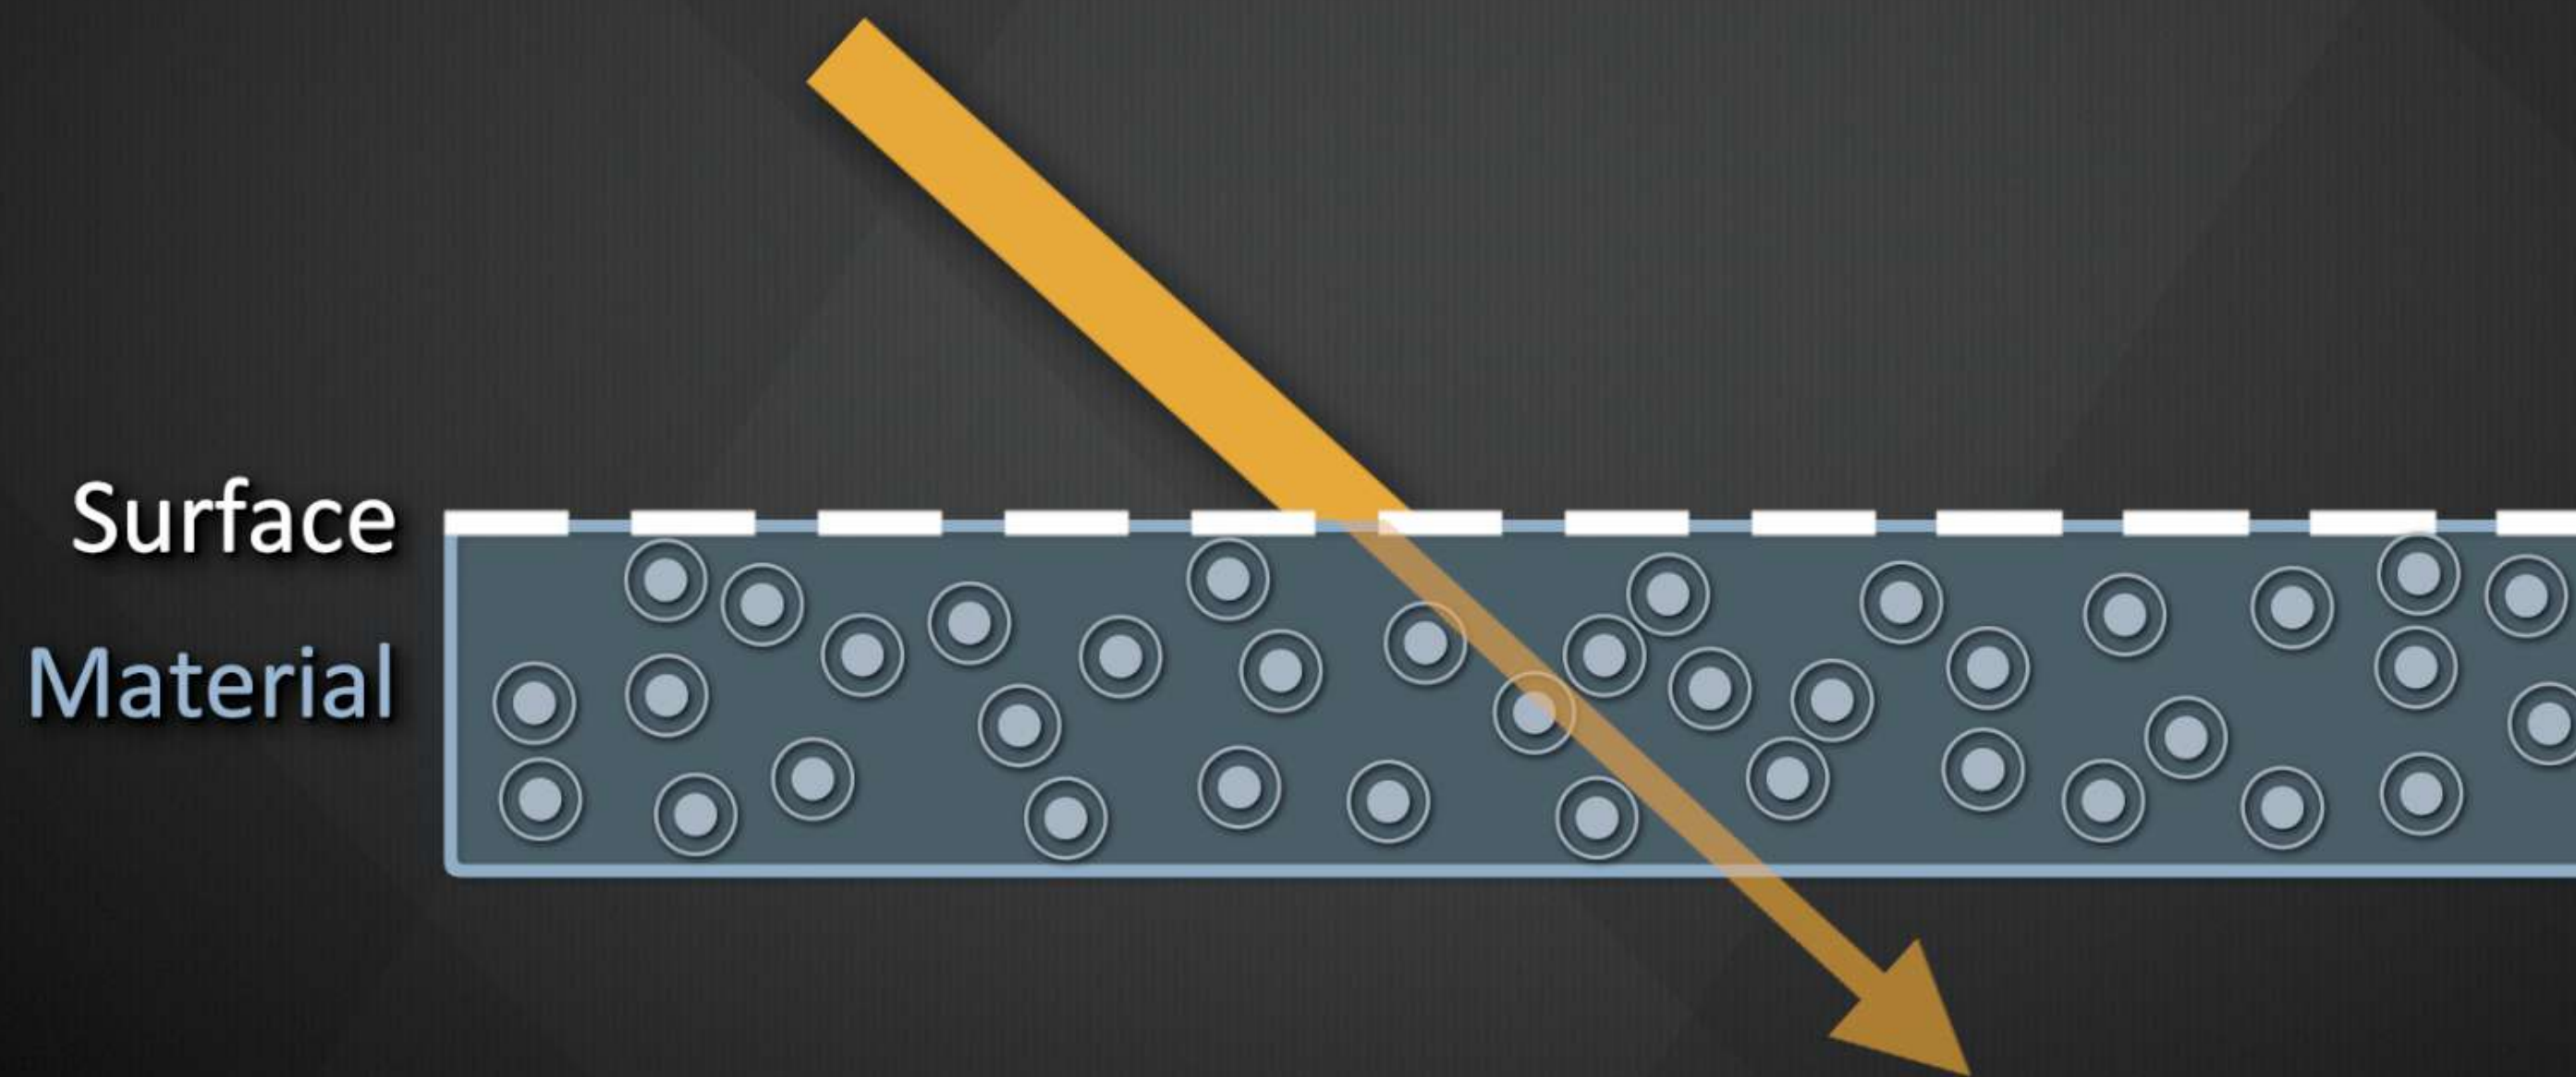

Light Material Interactions

LIGHTING CONCEPTS: Diffuse

Light Material Interactions

Transmission - Light Passing through a material / surface
- Transparency

LIGHTING CONCEPTS: Diffuse

Light Material Interactions

Refraction - When light changes direction as it goes through different materials

LIGHTING CONCEPTS: Diffuse

Light Material Interactions

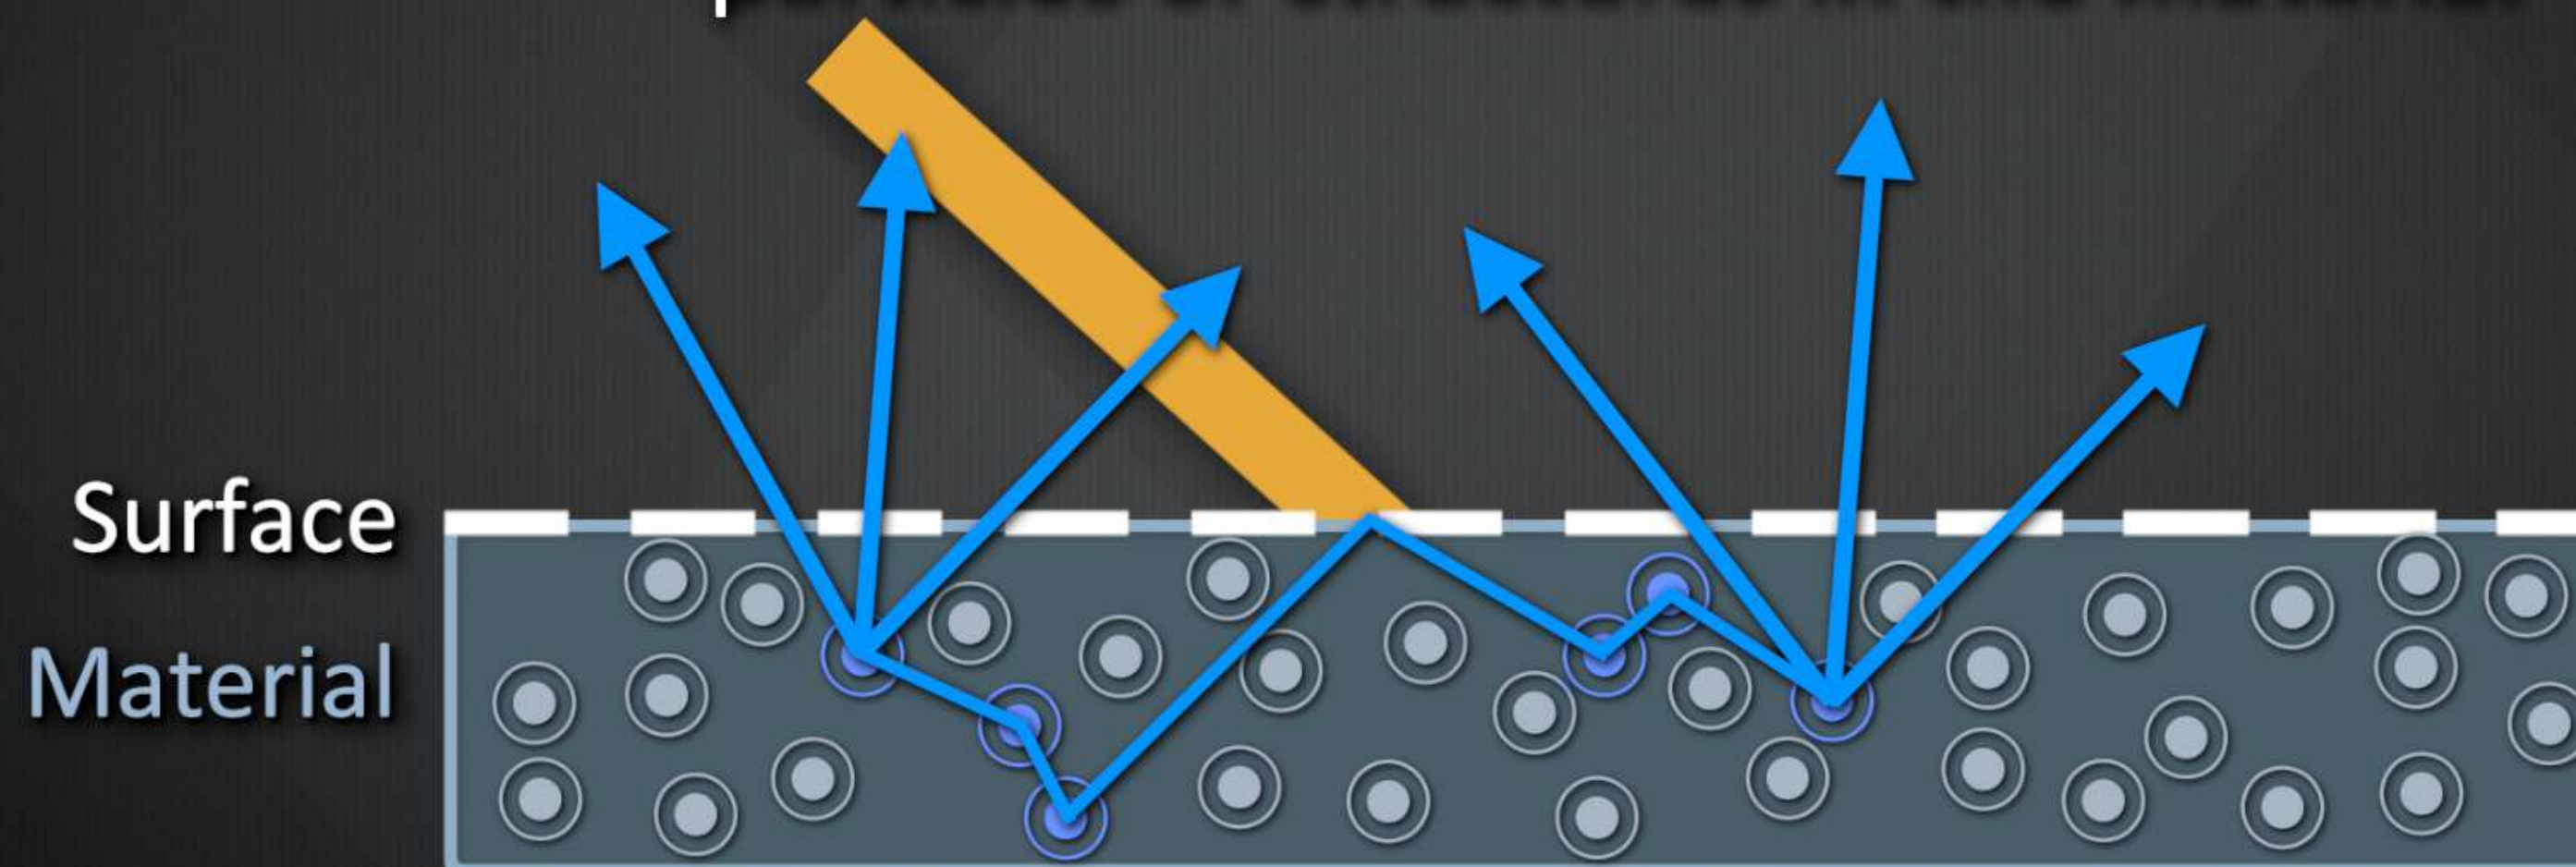

Absorption - When certain wavelength colors of light get absorbed by the material

LIGHTING CONCEPTS: Diffuse

Light Material Interactions

Scattering - When light is dispersed in many directions when it comes into contact with small particles or structures in the material

LIGHTING CONCEPTS:

Specular | Diffuse

- When the distance that light travels beneath the surface is insignificant and negligible, the calculation can be simplified by the renderer and just calculated at the surface point where the light hits. It uses the **Base Color Texture (Albedo)** as the **Diffuse Color** that will scatter.

Light Material Interactions

Light Material Interactions Simplified Calculation

LIGHTING CONCEPTS:

Diffuse | Sub Surface Scattering (SSS)

- When the distance the light travels beneath the surface of the material is significant, the interior scattering must be calculated. This is referred to as **Sub Surface Scattering (SSS)**

Physical Based Rendering Terminology

Albedo - Base Color Texture Map

- On Dielectrics (non-metal) refers to color of material
- On Metals, refers to the color tint of the specular reflection
- Texture map is without highlights, shadows, or ambient occlusion

<https://3dcoat.com/forum/index.php?/topic/26168-what-is-an-albedo-map-and-how-to-use-it-by-alex-glawion/>

<https://www.artstation.com/blogs/luismesquita/jGXd/everything-about-pbr-textures-and-a-little-more-part-2>

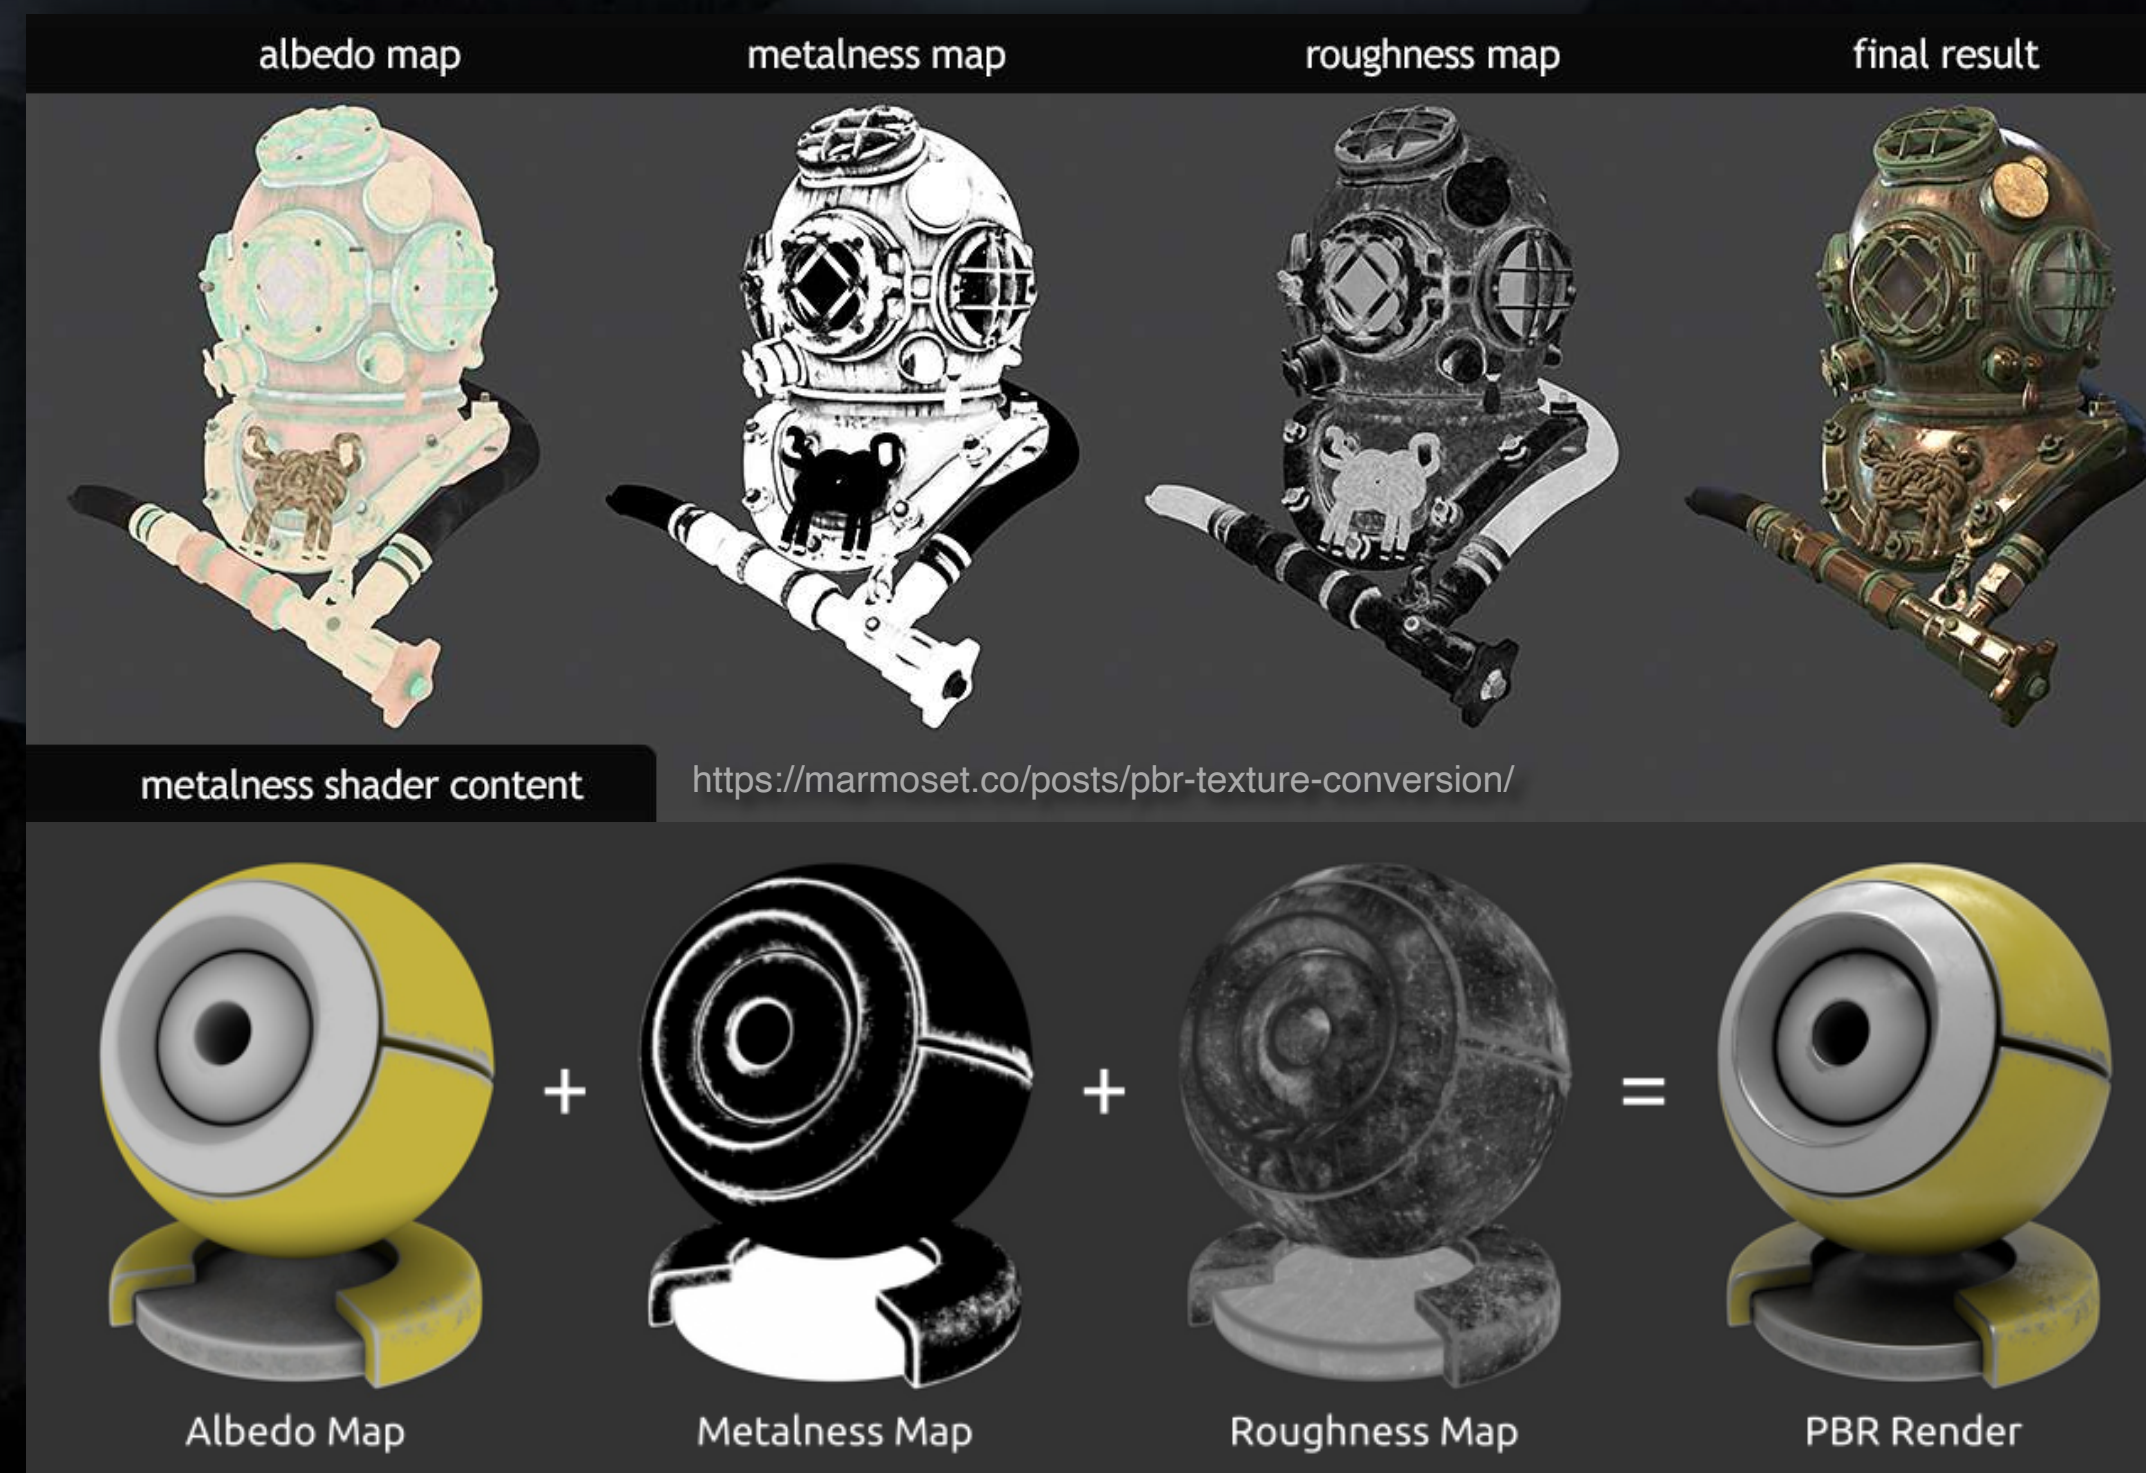

LIGHTING CONCEPTS:

Physical Based Rendering Terminology

- **Albedo** - Base Color Texture. On Dielectric (non-metal) refers to color of material, on Metals, refers to the color tint of the specular reflection.
- **Metalness** - What area is metallic or not. (will use Albedo Color differently). Usually Black or White
- **Roughness (Glossiness)** - How blurry or how sharp the reflection will be

<https://forum.reallusion.com/PrintTopic309180.aspx>

<https://marmoset.co/posts/pbr-texture-conversion/>
<https://meshlogic.github.io/posts/blender/materials/nodes-pbr-basic-shader/>

LIGHTING CONCEPTS: Specular vs Diffuse

- Real life objects and materials often have both Specular and Diffuse components

<https://www.olympus-lifescience.com/en/microscope-resource/primer/java/reflection/specular/>

<https://forum.unity.com/threads/specular-color-based-on-light-color.134412/>
User: Twiik

Photo by Tima Miroshnichenko from Pexels

LIGHTING CONCEPTS:

Iridescence

- There is also Iridescent materials that change specular color depending on viewing angle.
- Iridescence is a kind of structural coloration due to wave interference of light in microstructures or thin films.

LIGHTING CONCEPTS:

Specular | Diffuse | Emission

Recap

- **Emission / Illumination** materials emit light
- **Specular** and **Diffuse** can be separated by **Surface Level Reflections** and below surface **Material Interactions**
- Each individual light ray follows the **Law of Reflection**.
- The **smoother** a surface is, the more **mirror-like** the specular reflection will be.
- The **roughness** of a surface will cause the reflected rays to **scatter**, and reflection to be **blurred**.
- **Metallic** materials do not allow light to enter the surface. They only reflect light
- **Dielectric** materials allow light to enter the surface. Light rays are refracted, absorbed, scattered by the materials molecules. Certain color wavelengths re-exit the surface in random directions, which is what we perceive as the materials color
- **Albedo** - Base Color Texture. On **Dielectrics** - color of material | On **Metals** - color tint of the specular reflection.
- **Sub Surface Scattering** is when light below the surface travels a significant distance before re-exiting
- **Iridescent** materials tint the color of the **specular reflection** depending on viewing angle.

Specular | Diffuse | Emission

- **Specular** - Surface Level Reflection. Light bounces off surface.
- **Diffuse** - Light passes through surface and interacts with the material at a molecular level.
Absorption and Scattering
- **Emission** - Material that is emitting light into the scene.

Metallic | Dielectric (Non-Metallic)

- **Metallic** - Does not Absorb light. Base Color tints the specular reflection.
- **Dielectric** - Absorbs and Scatters light. Base Color describes which light wavelength is allowed to scatter off the material into the scene, the color not absorbed.
